THIS MONTH IN ANESTHESIA HISTORY
May 29, 1829: Sir Humphry Davy dies [he was born in 1778]. In addition to his pioneering work with nitrous oxide in Bristol in 1799 and 1800, Davy in 1815 invented a miner's safety lamp that saved many lives in British coal mines. Davy served as Professor of Chemistry at the Royal Institution in London from 1802-1812; during that time he made numerous contributions to progress in chemistry. In 1820 he was elected President of Britain's Royal Society, and at his death he was one of the world's most renowned scientists. His great contribution to anesthesia history is the massive book Research, Chemical and Philosophical, Chiefly Concerning Nitrous Oxide, published in the summer of 1800. Davy was the first human to inhale that gas. Recent biographies include David Knight's Humphry Davy: Science and Power [1992].
