36th Annual Reynolds-Finley Lecture
Review, Assess and Discuss Historical Aspects of the Health Care Sciences

Louis Pasteur and the Pleasures of Art

presented by

Bert Hansen, PhD
Professor of History, Baruch College,
The City University of New York

March 6, 2015
Historical Collections
The University of Alabama at Birmingham
Cover art: This original, painted illustration comes from the handwritten manuscript of Louis Pasteur’s studies on wine, *Études sur le vin* (1873), held at the Reynolds–Finley Historical Library.
As a souvenir of the 2015 Annual Reynolds-Finley Lecture we are pleased to offer our guests this reprint of one of Bert Hansen’s illustrated presentations on Louis Pasteur.
Bert Hansen has been teaching history at Baruch College of CUNY since 1994, following appointments at Binghamton University (SUNY), New York University, and the University of Toronto. He holds degrees in chemistry (Columbia) and history of science (Princeton). Trained as a medievalist, Hansen’s first book was *Nicole Oresme and the Marvels of Nature: A Critical Edition and Translation of “De causis mirabilium”* (1985). Articles have examined obstetrics teaching in the 1860s, the new medical categorization of homosexuals in the 1890s, the advocacy for public health and sanitation in political cartoons from 1860 to 1900, and the popularity of medical history heroes in children’s comic books in the United States (1940s) and in Mexico (1960s and 1970s). His second book, *Picturing Medical Progress from Pasteur to Polio: A History of Mass Media Images and Popular Attitudes in America* was honored with an award from the Popular Culture Association and named to “2010 Best of the Best” for Public and Secondary School Libraries by the American Library Association.

Thank you, Dr. Moss, for such a warm welcome. It is an honor to be addressing the American Osler Society as a McGovern lecturer and a pleasure to share with you the first public presentation of my current research on Louis Pasteur and the art world of the nineteenth century. Today’s talk offers early sketches from a rapidly expanding research project. Yet even a preliminary view will suggest, I hope, the fascination of looking at Louis Pasteur’s lifetime involvement with art and artists. I look forward to being able to present additional research in further publications.

Given William Osler’s passion for the humanities, I probably need not justify speaking to Oslerians about the great French chemist Louis Pasteur. But if I did, I might call on Dr. Osler himself, who signaled the importance both of Pasteur and of a biographical approach to history by writing a special introduction for several printings of the English version of the authorized Life of Pasteur, starting in 1911. The book had been published first in French in 1900, with the English translation appearing shortly thereafter. The author, René Vallery-Radot, a writer and the son of a librarian at the Louvre, was married to Pasteur’s daughter. Eventually he gave up other projects and became the official biographer and custodian of Pasteur’s public legacy. Vallery-Radot’s long and intimate relationship with his father-in-law gives this early account of Pasteur enduring value.

---

1 For assistance in research and in preparing this lecture for publication, I extend my gratitude to Boaz Adler, Kathryn Annette Clark, Caitlin Hawke, Helene Lipstadt, Harvey L. Mendelsohn, Sandra Moss, Blossom Appel Sanger, Carol A. Warren, and Renee Ziemer. My research, including travel to France and Finland, has received generous support from the George and Mildred Weissman School of Arts and Sciences of Baruch College, from Jeffrey M. Peck, Dean of the Weissman School, and from the PSC-CUNY Research Awards Program of the City University of New York.

2 The study of a singular episode in Pasteur’s life-long relationship with art, namely his close friendship with the Finnish painter Albert Edelfelt, is under review at a scholarly journal for publication as Richard E. Weisberg and Bert Hansen, “Collaboration of Art and Science in Albert Edelfelt’s Portrait of Louis Pasteur: The Making of an Enduring Medical Icon.”

3 Osler provided the following annotation for a copy of the 1911 London edition in his personal library: “A privately printed edition. My friend Mr. Henry Phipps was so impressed with Pasteur’s ‘Life’ and the value of its lessons that he offered to have a special edition printed if I would write an introduction. This I did with pleasure, and copies of the work were sent to the colleges, medical schools, and technical schools of the English-speaking world.” See Bibliotheca Osleriana (Oxford: Clarendon Press, 1929), p. 154. For more on his relation to the book, see Harvey Cushing, The Life of Sir William Osler, 2 vols. (Oxford: Clarendon Press, 1926), at II: 241, II: 261, II: 294, II: 311, and II: 321.

4 The first edition is René Vallery-Radot, La vie de Pasteur (Paris: Librairie Hachette, 1900). The English translation by Mrs. R. L. Devonshire appeared soon thereafter in England and the United States. Both versions were often reprinted.
Three books from the mid- and late-twentieth century substantially enlarged scholarly and popular understanding of Pasteur’s career, and I owe them much, even though none of them paid serious attention to the artistic side of Pasteur’s life. The first two were biographies written by active scientists. René Dubos was not only a leading biologist, but a cultivated European intellectual who wrote a number of successful books explaining science to a general audience. While his *Louis Pasteur: Free Lance of Science* (1950) was based on extensive research, it included no reference notes, even for quotations; in compensation, the writing was elegant, the explanations lucid, and his understanding of the French context of Pasteur’s work exemplary. Patrice Debré’s substantial and comprehensive biography, entitled simply *Louis Pasteur*, appeared in French in 1994 and in English in 1998. Debré adopted a strictly chronological approach, as had Vallery-Radot nearly a century earlier, but he drew on modern historical scholarship and leavened it with especially good explanations of the science, grounded in his own work as an immunologist. While the title of historian Gerald L. Geison’s *The Private Science of Louis Pasteur* might seem to promise an examination of only a selection of Pasteur’s experiments, it is both wide-ranging and perceptive, and for many of the major discoveries it offers the best analysis of Pasteur’s research. It is based on Pasteur’s laboratory notebooks, which had not been available to earlier scholars. Still useful, too, is Geison’s “Louis Pasteur” entry in the *Dictionary of Scientific Biography* published in 1974, a remarkably comprehensive account. Richly detailed and well balanced, this sixty-six-page, double-column article is virtually the length of a book.

My title phrase referring to Pasteur’s “life in art” is intentionally ambiguous. This morning we will look not only at examples of how artists portrayed the great chemist, but also at some of his personal experiences inside the world of art. This second, little-known aspect

---

of his biography embraces drawings and lithographs made by Pasteur himself, his deep friendships with artists, his teaching in an art school, and his patronage of painters and sculptors. Once Pasteur became famous, many artists made portraits of him. To take just one example of Pasteur in art, and also to honor Dr. McGovern for whom this lectureship is named, I start with a group of twelve high-relief panel sculptures made by Doris Appel about seventy-five years ago. Today these sculptures are on display in the John P. McGovern Hall of Medical History at the University of Texas Medical Branch at Galveston. (Another set is found at Boston University.) An early photo shows them as they were first publicly exhibited in the Medical Museum of the Armed Forces Institute of Pathology in Washington, D.C. (Figure 1). Pasteur holding a rabbit is the fourth figure from the right, behind Marie Curie, Wilhelm Roentgen, and Joseph Lister. This array reminds us of the chemist Pasteur’s place in medical history, though today I do not have time to recount his scientific achievements. His science, along with its applications in medicine and public health, is of course the basis for why we might care about his personal life or about his life in art. Today my aim, rather, is to illustrate another facet of the personality of the stony-faced, authoritarian, dour workaholic we know from the published literature and from the depictions of many artists. Here we see the familiar Galveston building, where Doris Appel’s large sculpture panels are housed (Figure 2), along with two different busts of Pasteur made by Appel (Figure 3).

Before approaching Pasteur’s life, I want to say a little about how I took up this project after working for many years on medical imagery in American popular culture. A few years ago, I began research

---

on Pasteur’s art-world friendships in collaboration with Richard E. Weisberg, a former graduate student of mine, who had written a term paper (1987) and then a full dissertation (1995) about medical portraiture in France around the 1880s. Richard had finished his dissertation in 1995, but the demands of being a teacher, administrator, and principal never allowed him time to publish any of it. In 2010, I proposed we undertake a joint project, and Richard welcomed the chance to return to active scholarship alongside his other responsibilities. Unfortunately, he died unexpectedly a year later, in May 2011, and I have carried on alone. In order to share his valuable research with other scholars, I created a website and posted his entire dissertation for use by readers worldwide. The site has had over 900 visits, from 41 countries. Almost half have come from outside the US, with France leading the other countries. Spain and China are in third and fourth place.

Louis Pasteur was only thirteen years old when he took up drawing, the start of a long-term engagement with the fine arts. He studied drawing formally with two teachers, Étienne-Charles Pointurier in Arbois and Charles-Antoine Flajoulot in Besançon, becoming especially skilled in the relatively new medium of pastels. We do not know how many works he created before putting his pencils aside at age nineteen, but about thirty examples have survived, most of them elegant and convincing presentations of the faces of friends, family members, and local residents. Pastels of his mother drawn in 1836 and of his father in 1842 reveal his eye for detail and a balanced composition (Figure 5 and Figure 6).

The young man who was able to see and capture these features so successfully grew into a scientific observer of nature *par excellence* and a laboratory worker whose characteristic discoveries were often made by acute visual inspection of physical objects. Pasteur often saw things that others overlooked, whether they were facets of crystals, particles in the bodies of diseased silkworms, or micro-organisms cultured in murky broth (rather than in the solid culture media that came into use later).

After Pasteur finished graduate study in Paris at the École Normale, where he defended doctoral theses in both physics and chemistry at the age of twenty-five, he held a succession of teaching positions of increasing status. He went first at age twenty-six to the university in Strasbourg in January 1849, and he married the Rector’s daughter the following spring. After six years there, he moved with a growing family to Lille. After another three years outside the metropolis, he returned to the École Normale in Paris at the age of thirty-six in 1858. He then remained in the capital city until he died nearly forty years later, except for vacations at his family home in Arbois, travel to scientific conferences abroad, and research expeditions on yellow fever, silk-worm diseases, and anthrax.

As a young man of twenty-nine, while teaching at Strasbourg, he made an important research trip to vinegar factories in Zwickau, Vienna, and Prague. While abroad, he made a special effort to visit museums and other artistic sites. In Vienna, for example, Pasteur specifically sought out the funerary monument for Marie Christine of Habsbourg-Lorraine, done by the great Italian sculptor Antonio Canova about 1805. In a letter to his wife, Pasteur declared it “the most beautiful of Canova’s masterpieces,” writing her that “you cannot imagine anything more touching and more remarkable as a work of art.” (Figure 7) Pasteur told her that as sculpture this monument surpassed even the “magnificent tomb” of the Marshall of Saxony by the Parisian sculptor Jean-Baptiste Pigalle. 13 This ensemble of dramatic figures may still be seen in the St. Thomas church in Strasbourg, the city in which the Pasteurs were then living.

---

(Figure 8). We may assume they had seen it together, perhaps even discussing its beauty.

In another letter to his wife, he wrote about the art he had seen in Dresden, “I can assure you that I saw some admirable things. There is a most beautiful museum containing pictures by the first masters of every school.” In the same letter, he wrote, “I spent over four hours in the galleries, noting in my little catalogue the pictures I most enjoyed. Those that drew my attention I marked with a cross; but soon I was putting two or three crosses, according to the degree of my enthusiasm. I even went as far as four.” His letter continued, “I also visited what they call the Green Vault [named for the columns painted green with malachite pigment], an absolutely unique collection of works of art, jewelry, and precious stones collected at great expense by a prince.”

But art was not something Pasteur reserved only for travel to other cities. At home in Paris, Pasteur was an enthusiastic visitor to the annual exhibitions known as the Salons, which he often attended with artist friends, as well as with Madame Pasteur and, on occasion, with their married children and their spouses. Each spring, and sometimes in the fall as well, Paris was home to enormous art exhibits, first at the Louvre, but later in newer exhibition halls. The May first opening day was an event for the whole city, marked by crowds, newspaper reviews, special editions of magazines, the publication of official catalogues listing the works, and magazine reviews, sometimes running to hundreds of pages in several installments. In characteristic “Salon style,” the pictures were hung all up and down the crowded walls, making the ones that were “skied” very hard to see.

The purpose of these government-sponsored exhibits was two-fold: to showcase the best works by contemporary artists and to publicly uphold standards by awarding medals and making purchases for the State. Among the numerous submissions, those to be shown had to be selected by a jury of artists. There was an exception for works by

---

14 Correspondance I: 218–219 (September 23, 1852, to Madame Pasteur.)
a limited number of established artists who were allowed to submit outside of the competitive process (hors concours). First-, second-, and third-class medals gave publicity and status to those honored with them. The shows were enormous: the total of number of paintings, sculptures, drawings, and engravings often ran as high as 5,000. During the six- to eight-week run, attendance might exceed half a million visitors in some years.

Alongside the Salons, a second major institution of the art establishment was the National School of Fine Arts, or École des Beaux-Arts. In 1863, just as he was turning forty-one, Pasteur added an entirely new set of teaching responsibilities at this school, in addition to his on-going work at the École Normale. He gave lectures and demonstrations at the École des Beaux-Arts as their very first professor of geology, physics, and chemistry. For nearly four years, he offered courses about ventilation in buildings, pigments, varnishes, factors affecting the way oil paint dries, and other physico-chemical aspects of the fine arts. The lectures were not published at the time, but some are now available in his Oeuvres, where scholars can follow his teaching in these areas. I have not yet found much direct evidence about his interaction with students, but it is clear that he developed close and lasting friendships with several of his fellow teachers.

In the mid-1870s, when Pasteur was in his early fifties and becoming renowned for his new understanding of fermentation and for key improvements in the production of wine and beer, his friend Paul Dubois was France’s leading sculptor of portrait busts. Both Keeper of the Luxembourg Palace collection and director of the École des Beaux-Arts, Dubois was at the top of the profession. Not surprisingly, Dubois was the artist from whom J. C. Jacobsen, the founder of Carlsberg Brewery in Copenhagen and a great patron

---

of the arts, commissioned a marble bust of Pasteur for the research laboratory he established there. Jacobsen felt his commercial success was heavily indebted to Pasteur’s studies on beer, and he wanted to show his appreciation to Pasteur. Jacobsen, in fact, was the first brewer anywhere to establish a research laboratory on site, and the bust was prominently displayed there (Figure 9).

About 1881, Pasteur was introduced by his son Jean-Baptiste to a young Finnish painter living in Paris, Albert Edelfelt. Pasteur took a strong liking to Edelfelt, and the art produced by this friendship would have major impact on the careers of both men. Edelfelt’s portrait of Pasteur at the Salon of 1886—which offered an exceedingly favorable image of the man of science—was a great success; it made the artist famous and provided Pasteur with new visibility among the general public. Edelfelt became close with the other family members, too. Pasteur enjoyed conversing with Edelfelt about art and had him do portraits of other family members. Over the course of many years Edelfelt painted portraits of Pasteur’s son, his daughter-in-law, his daughter, his son-in-law, his granddaughter and his grandson; and some years after Pasteur’s death, Madame Pasteur also agreed to sit for a portrait.

Edelfelt painted this great and justly famous portrait of Pasteur in the spring of 1885, when the latter was sixty-two years old. It may be familiar to some of you as it has been quite often reproduced. For clarity, I show it here in a photogravure distributed in 1894 in Great Men and Famous Women (Figure 10). The painting now hangs in the Orsay Museum in Paris, and a full-size copy made by Edelfelt himself is in the Pasteur Museum at the Pasteur Institute in Paris. This image of Pasteur working in his laboratory, seemingly oblivious to the painter or to the viewer, is different from the much more common “studio portrait,” which is painted in an artist’s workshop to which the subject comes for repeated sittings. In most such portraits the subject is posed in a way that acknowledges the painting’s viewers. Untypically for this reserved scientist, yet perhaps

---

16 Richard Weisberg and I have examined the personal relationship between the French chemist and the Finnish painter in an article cited above.
because he knew first-hand the needs of a portrait artist, the busy and generally very private chemist acceded to Edelfelt’s request to paint him right in the middle of the laboratory among the animals, experiments, and scurrying assistants. Edelfelt worked on the painting during the spring of 1885 and finished it before summer vacation, but it was not exhibited in Paris until the following spring’s Salon, which opened on May 1, 1886. While the portrait was being painted, rabies was still a minor disease with little public interest; and Pasteur’s experiments were still being conducted only on rabbits and dogs. He had not treated a human dog-bite victim, nor even tested his vaccine in humans for safety, let alone efficacy. Edelfelt composed a powerful image of the chemist alone in his laboratory, holding a drying bottle with the powerful reagent, the virus-laden spinal cord of a rabbit that died of rabies. When painted in early 1885, this was not an image of a miraculous cure or of a medical hero. But events would shortly endow it with those new meanings.

By the Salon’s opening in May 1886, a medical revolution had taken place. The cord hanging in the drying bottle in Edelfelt’s contemplative portrait had become a life-saving cure, and Pasteur, a chemist, was being celebrated around the world as a medical hero. Since he was not a physician, all the injections were given by medical doctors, but Pasteur had become a savior of mankind because his treatment seemed to rescue dog-bite victims from the often fatal consequences they would otherwise have suffered. Unlike Jenner’s vaccine (which was preventive), this new rabies vaccine acted as a cure since it was given after a person was bitten. The world was thrilled. Pasteur’s first successful treatment of a dog-bite victim (named Joseph Meister) had been undertaken in July of 1885 and announced to the scientific world in late October. Soon thereafter Pasteur reported on his second case, Jean-Baptiste Jupille, a fifteen-year-old shepherd from Villers-Farlay, a village not far from Pasteur’s family home in Arbois, who had been badly bitten as he tried to subdue a mad dog attacking several younger children. In a well-known engraving Jupille received treatment from Dr. Joseph Grancher under Pasteur’s watchful eye (Figure 11). When Pasteur reported on the incident to the Academy of Sciences, he proposed that Jupille receive the French Academy’s
Montyon Prize, which was established to reward exceptional bravery on the part of an ordinary French citizen. The press loved the story of the boy’s heroism, and he received the remarkable gift of one thousand francs. Several illustrators and artists depicted Jupille’s struggle with the vicious dog, thereby giving Pasteur additional press attention. The rabies vaccine brought Pasteur an unprecedented level of popular appreciation, and when he appealed to the world to contribute to the creation of a permanent institution for providing rabies shots, the donations were immediate and substantial, ranging from pennies sent by children to huge donations received from bankers, entrepreneurs, and royalty. An attractive building was quickly erected, and the Pasteur Institute was formally inaugurated in November 1888, when Pasteur was nearly sixty-six (Figure 12).

The anecdote of Jupille’s shepherd-boy heroism was so popular that in the Salon of 1887 two artists, Athanase Fossé and Émile Louis Truffot, exhibited sculptures of Jupille with the dog. Pasteur commissioned a bronze replica of Truffot’s work for the future Pasteur Institute. After the Institute opened in late 1888, this piece could be seen near the entrance on a pedestal in the garden. Jean-Baptiste Jupille later came to work as a guard at the Institute, and he often posed for photographs with the sculpture, as in this one from 1913 (Figure 13). This image confirms that Pasteur actively cultivated his reputation—and ultimately his legacy—not only through his science, but through painting and other works of public art. In the twentieth century, a bronze portrait bust of Pasteur by Naoum Aronson was placed near the entrance, and the Jupille bronze was moved to the side of the building, where it still stands. The latter sculpture gained much wider currency during the later twentieth century, when it was reproduced on France’s five-franc note, in use from the nineteen sixties until the introduction of the Euro (Figure 14).

In 1892, France’s government and its institutions of higher education jointly sponsored an enormous jubilee celebration in honor of Pasteur’s seventieth birthday. The ceremony took place in the Sorbonne’s new building, which had opened just three years before. That building encompassed a huge program of art,
including many statues and quite a few murals depicting scenes from
the history of science and medicine. Among all the accolades from
the leaders of government and science, two were especially moving
to Pasteur himself. The British surgeon Joseph Lister had early
recognized the significance for surgery of Pasteur’s demonstration
that germs are carried on tiny particles in the air. Lister’s techniques
had revolutionized surgery and made him world famous, but
he always insisted on acknowledging his debt to Pasteur. Lister’s
personal appearance at the ceremony was a great tribute and an
emotional moment for Pasteur. For the celebration, the sculptor
and medalist Oscar Roty, a pioneer of the Art Nouveau style, created
a silvered bronze plaquette for presentation to Pasteur (Figure
15). Pasteur was given the medal in advance, and he mentioned it
in his remarks that day. Those remarks, incidentally, were read to
the assembly by Jean-Baptiste Pasteur as his father was too weak to
deliver them himself.

When Pasteur died three years later, his funeral was declared a state
occession—only the second time a scientist had been so honored.
High officials and ordinary Parisians turned out for the procession
to the Cathedral of Notre Dame. Many had expected that Pasteur
would be interred in the Pantheon, with other French heroes
like Voltaire, Rousseau, Hugo, Zola, and later Marie Curie. But
Madame Pasteur refused that honor for her husband, perhaps
because the Pantheon was a symbol of secularism. Instead, Pasteur
was buried in a chapel-like crypt within the very Institute that had
been built to extend his scientific legacy.

Soon after Pasteur died, a public outdoor monument was planned
for the Place de Breteuil, a small park within a traffic circle, a
ten-minute walk from the Pasteur Institute. The sculptures were
completed by 1901, but the monument was erected only a few
years later. Here Pasteur sits high in the open air, and life-sized
sculptures of people, animals, and plants, along with a figure of
Death surround the monument’s thick base (Figure 16). It is fitting
that a man who devoted much time and energy to the appreciation
and support of artists, especially those working in the academic-
realist tradition, was honored with a composition that includes naturalistic representations of people and animals, meant to remind later generations of Pasteur’s humanitarian achievements. A female figure celebrates the successful grape harvest and wines preserved by pasteurization. A cowherd tending his cattle heralds the anthrax vaccine. Also present is a shepherd whose flock is likewise protected from anthrax. An allegorical figure of Health supports a woman holding a child, and the figure of Death has been vanquished by Pasteur’s efforts against infectious diseases.

Parisians and tourists alike encounter Pasteur memorials with regularity. Not just on the Boulevard Pasteur with its Pasteur Metro stop, or on the smaller rue Pasteur, or near the Pasteur Institute with its outdoor sculptures, or within the quadrangles of the École Normale, but also seated stoically in his chair at the top of this weathered monument. Perhaps his most impressive appearance, however, is reserved for one of the city’s most popular museums. In the Musée d’Orsay, the Edelfelt painting of Louis Pasteur intently concentrating on his work is permanently displayed for multitudes of art lovers, very few if any of whom, we must assume, realize that this sober chemist was himself a passionate lover of art, artists, and art museums.

As of March 2015, three scholarly articles expanding upon the lecture printed here are in press:

Hansen, Bert, and Richard E. Weisberg, “Louis Pasteur (1822–95), His Friendships with the Artists Max Claudet (1840–1893) and Paul Dubois (1829–1905), and His Public Image in the 1870s and 1880s,” Journal of Medical Biography (Royal Society of Medicine, London), forthcoming 2015.
