

Circadian rhythm of blood pressure and plasma sodium

Circadian rhythm of sympathetic nervous system activity

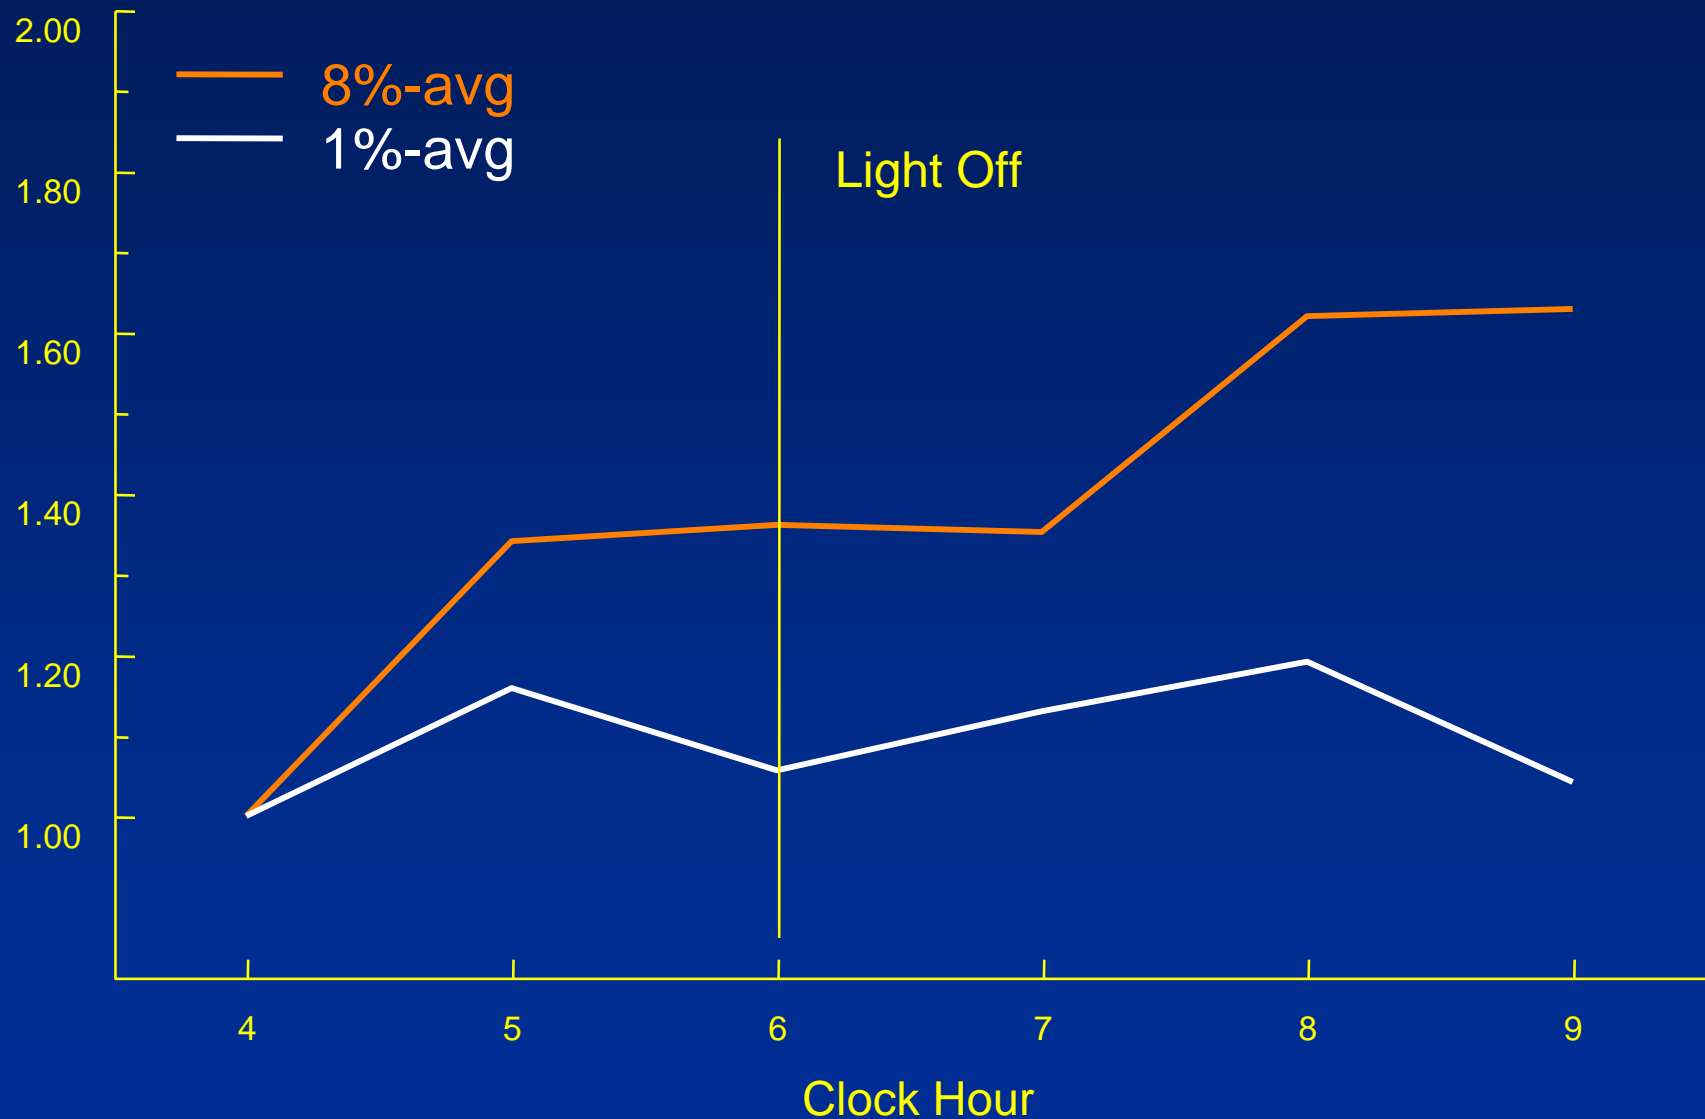

16:00 h

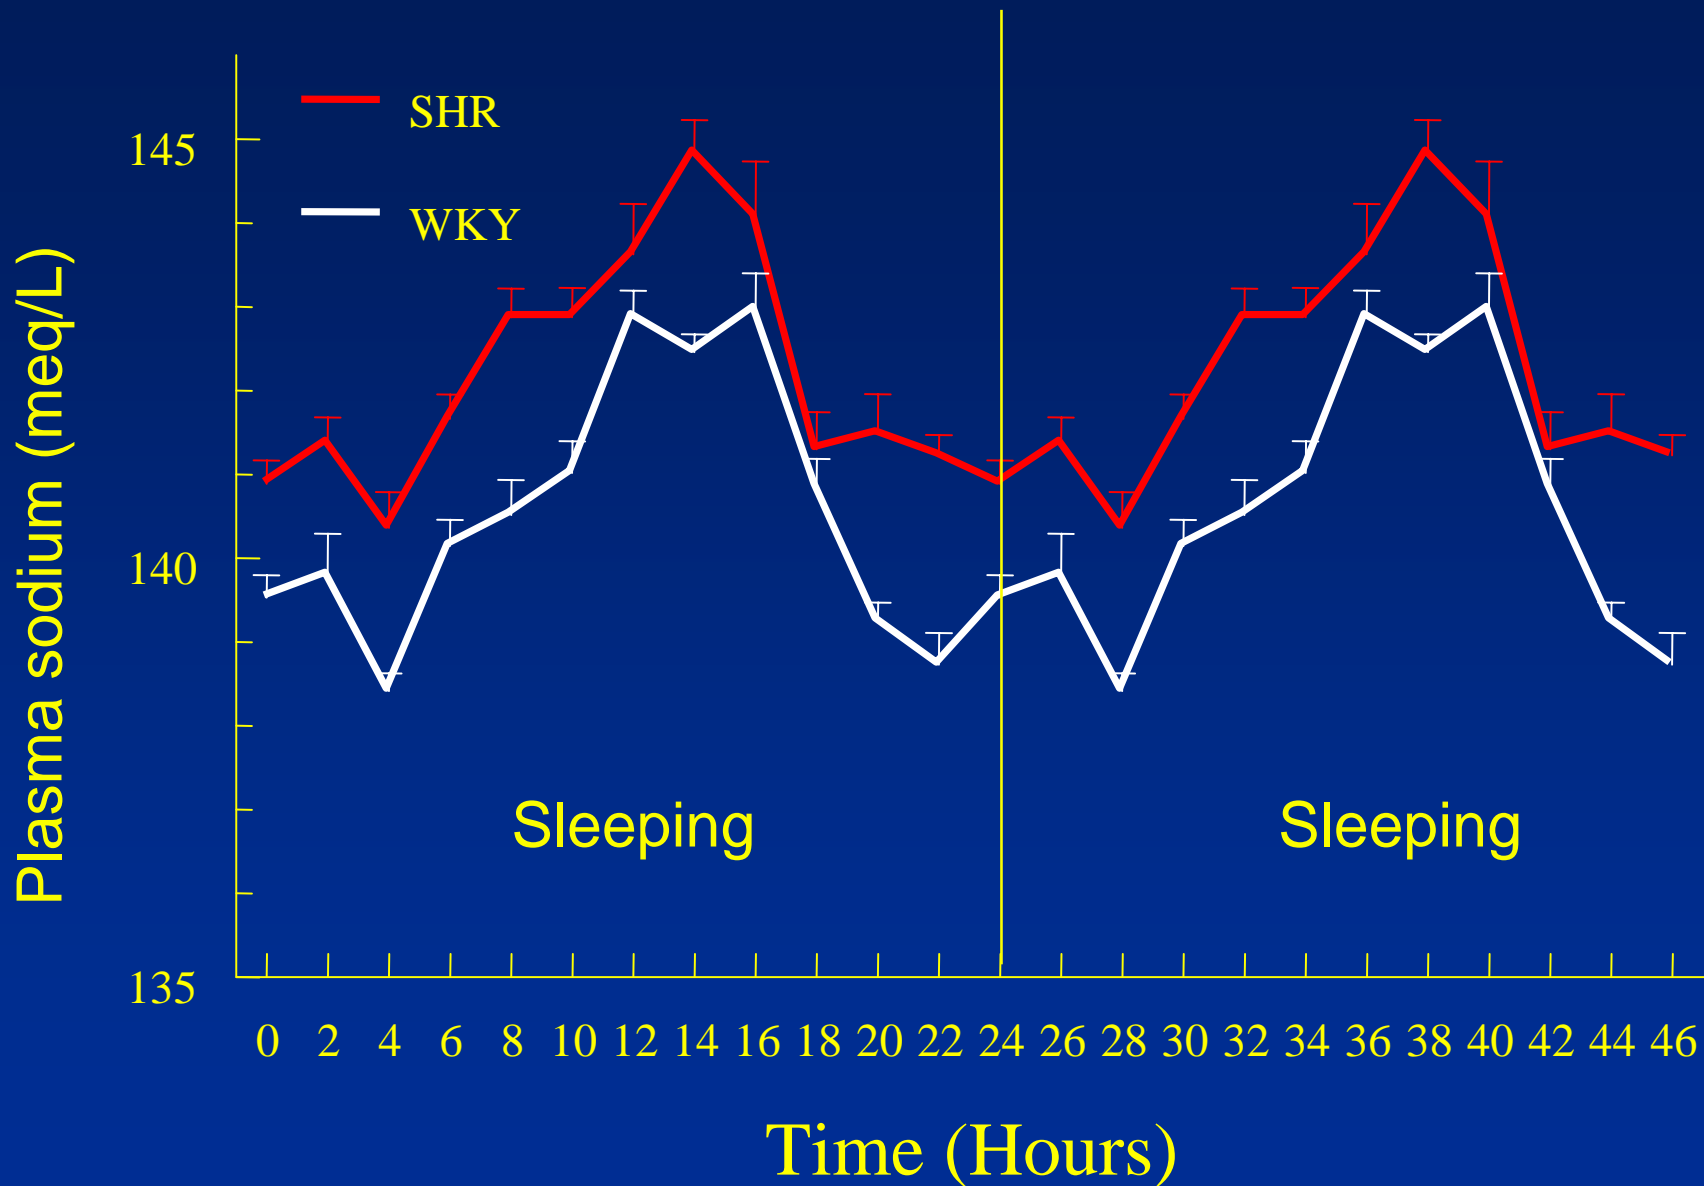

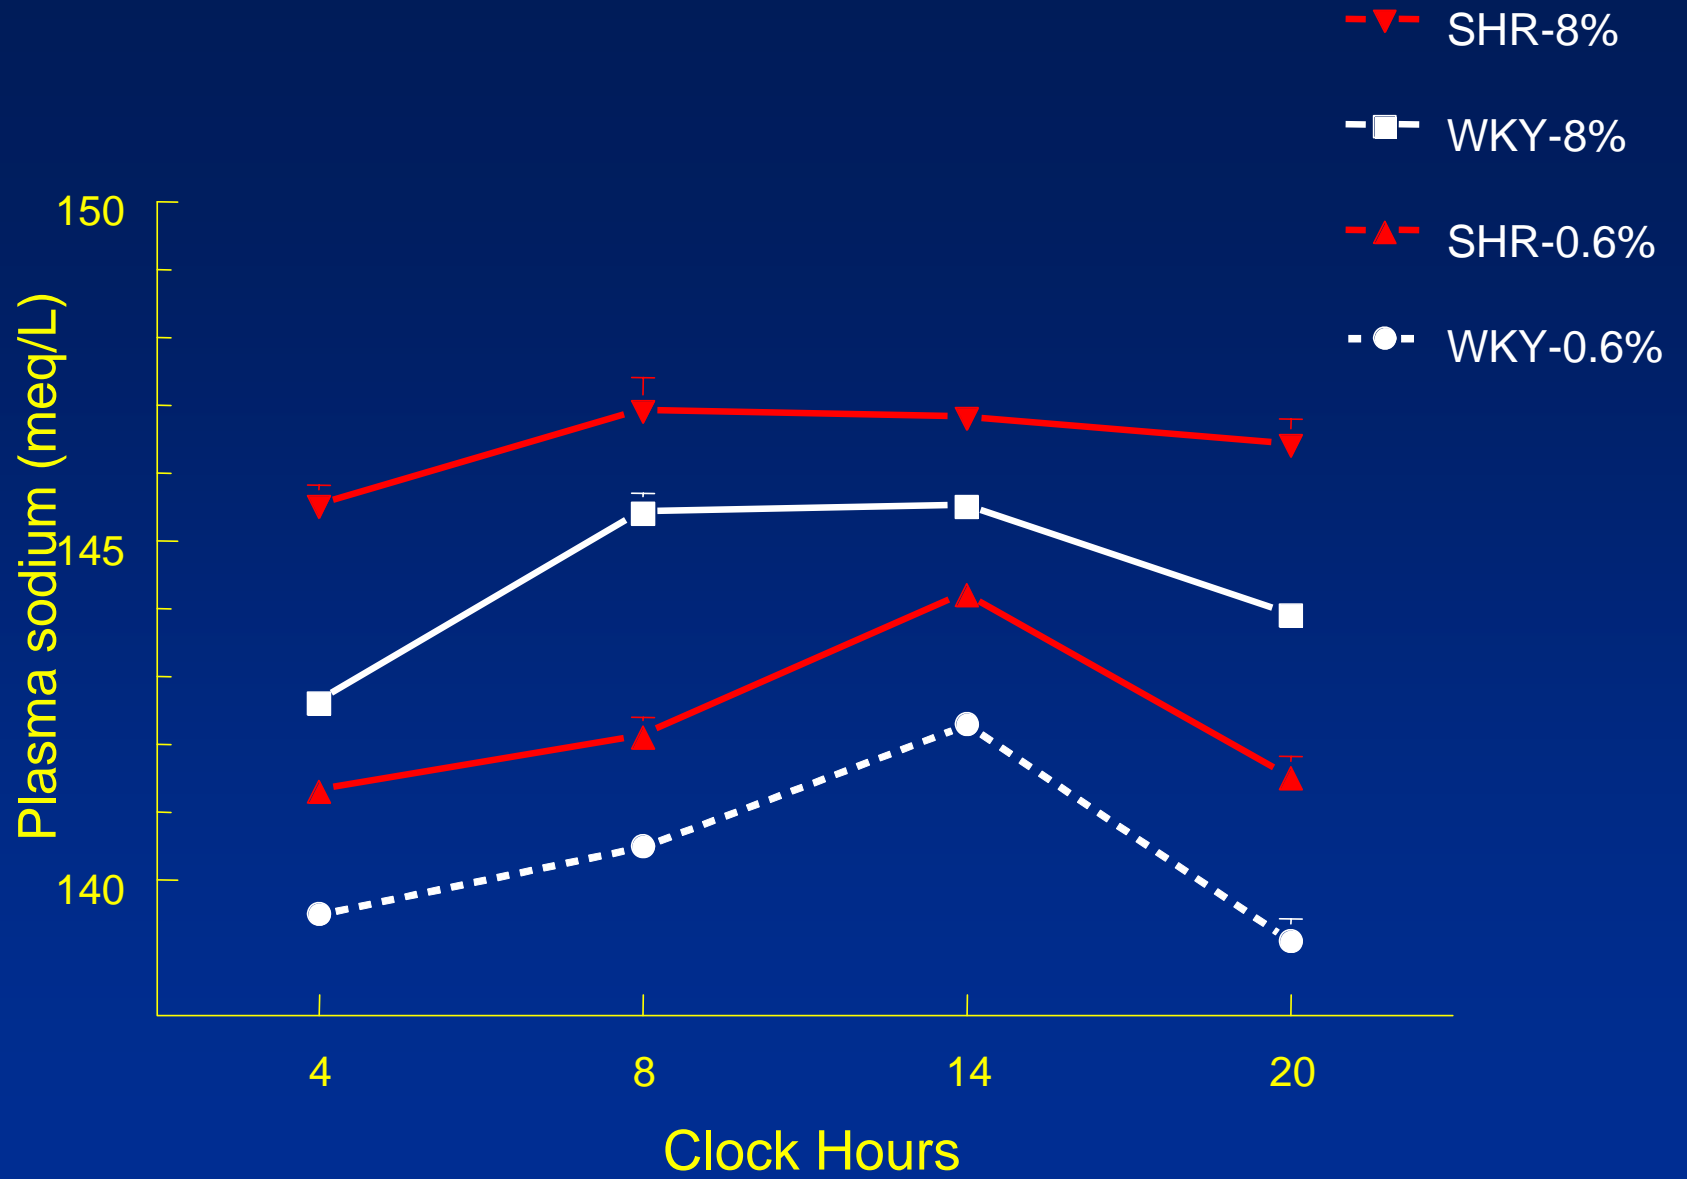

19:00 h

Circadian rhythm of sympathetic nervous system activity at time of awakening

Plasma Sodium Rhythm in WKY vs. SHR

Methods to measure blood pressure and heart rate

- Tail cuff
- Tethered catheter
- Telemetry: gold standards

Methods to measure blood pressure and heart rate

- Tail cuff
 - Easy to do
 - Inexpensive
 - Good for longitudinal studies

 - But
 - About 20 mm detection limit
 - Relative worse in mice
 - Greatly effected by stress

Methods to measure blood pressure and heart rate

- Tail cuff
- Tethered catheter
 - Very good for acute studies
 - Inexpensive but labor (surgery) intensive
 - Much more accurate than TC

 - But
 - Prone to stress from tethering
 - Can lose patency
 - Use heparin to maintain patency

Methods to measure blood pressure and heart rate

- Tail cuff
- Tethered catheter
- Telemetry: gold standards
 - Very accurate
 - Circadian cycle monitored easily (set it and forget it)
 - But large transmitter for small animals
 - Battery life relatively poor
 - Very expensive (up to \$500/mouse)

Methods for MAP Measurement in Mice

- Tail Cuff (Kroger et al.)
- Acute Catheterization (Tian et al.)
- Chronic Catheterization
- Telemetry

Telemetric Recording in Mice: A Comparison of Carotid and Abdominal Aorta Implantation

The effect of a high NaCl diet on MAP
and HR in mice

Carlson and Wyss. *Hypertension*, 35: e1-e5, 2000

Abdominal Aorta Implantation

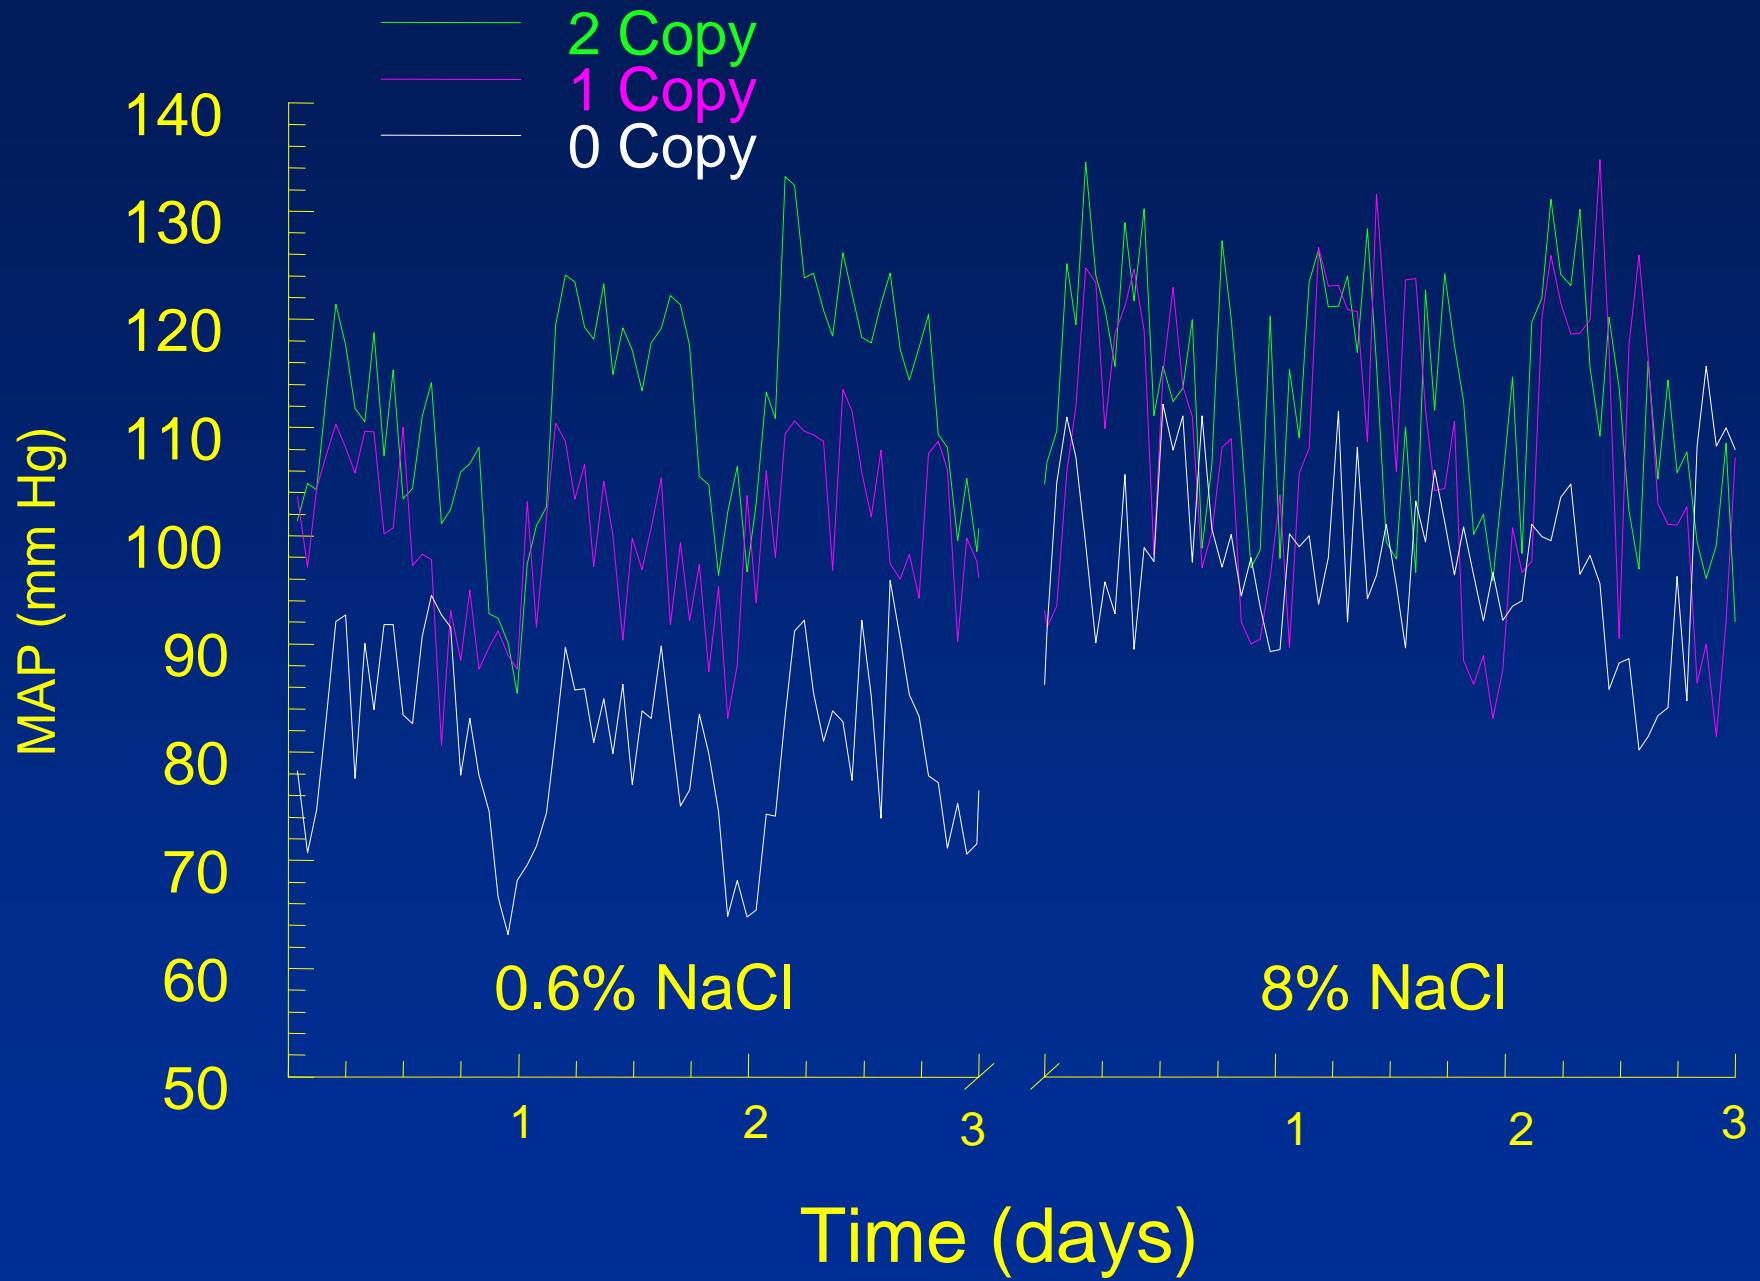

- Sterile conditions
 - Hair removed
 - Disinfection
- Isoflurane anesth.
- Minimal disturbance of aorta
- Minimal occlusion time
- Catheter smoothness
- Probes warmed
- Minimal Vet-bond
- Post-op heating

Carotid Artery Implantation

- Isoflurane or injectable anesthesia
- Aseptic conditions
- Incision from right shoulder to mid-scapular region
- Slide probe under skin
- Suture through muscle around probe
- Sutured to skin

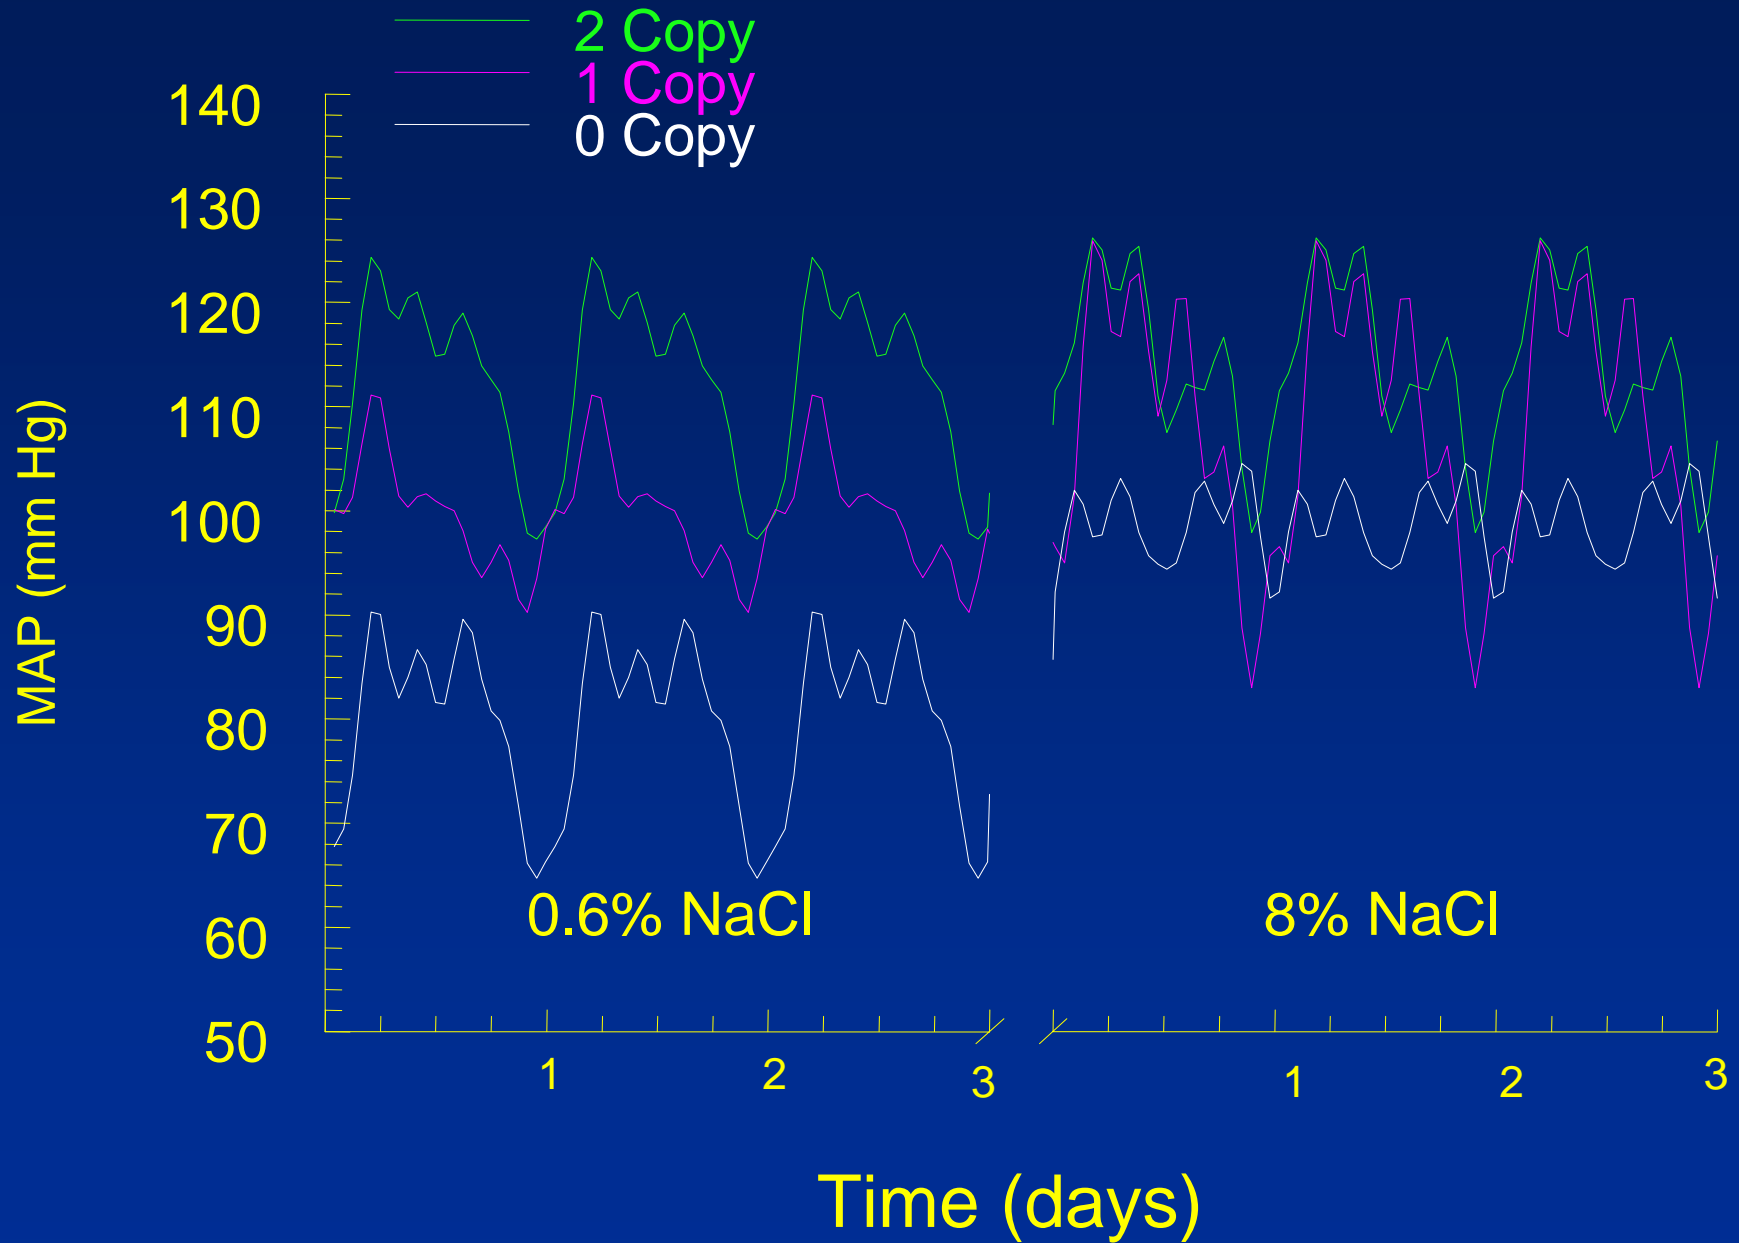

Table 1. Mean Arterial Pressure (MAP) and Heart Rate in 2 Copy (+/+; n=7), 1 Copy (+/-; n=7) and 0 Copy (-/-; n=6) ACE Knockout Mice Maintained on a Basal (0.6%) NaCl Diet

	+/+	+/-	-/-
<i>24-Hour MAP Rhythm (3-day averages):</i>			
MESOR (mm Hg)	111.8 ± 4.2	100.0 ± 3.5*	80.7 ± 3.7*#
Amplitude (mm Hg)	19.8 ± 0.6	12.6 ± 0.5*	17.7 ± 0.7
Acrophase (Hour)	01:16 ± 1.0	10:01 ± 0.7#	02:11 ± 0.7
Peak (mm Hg)	126.2 ± 3.6	111.4 ± 1.0*	93.4 ± 1.8*#
Nadir (mm Hg)	93.5 ± 4.1	84.7 ± 2.9	64.4 ± 0.7*#
<i>24-Hour MAP Rhythm (3-day averages):</i>			
Heart Rate (bpm)	551.7 ± 14.1	555.1 ± 12.0	457.9 ± 9.8*#

* p < 0.05 versus the +/+ group; # p < 0.05 versus all other groups

Surgical Protocol

- Anesthesia
 - Ketamine (100 mg/kg) - Xylazine (15 mg/kg) diluted in 0.9% NaCl
 - Isoflurane (inhalant)
- 7-Day Recovery Period

Do a cost benefit assessment before
you dive in.

Other hormones

Behavior

- Cognition
 - Learning and memory
- Motor function
- Sensory function
- Motivation

Behavioural tasks

Behavior

- Cognition

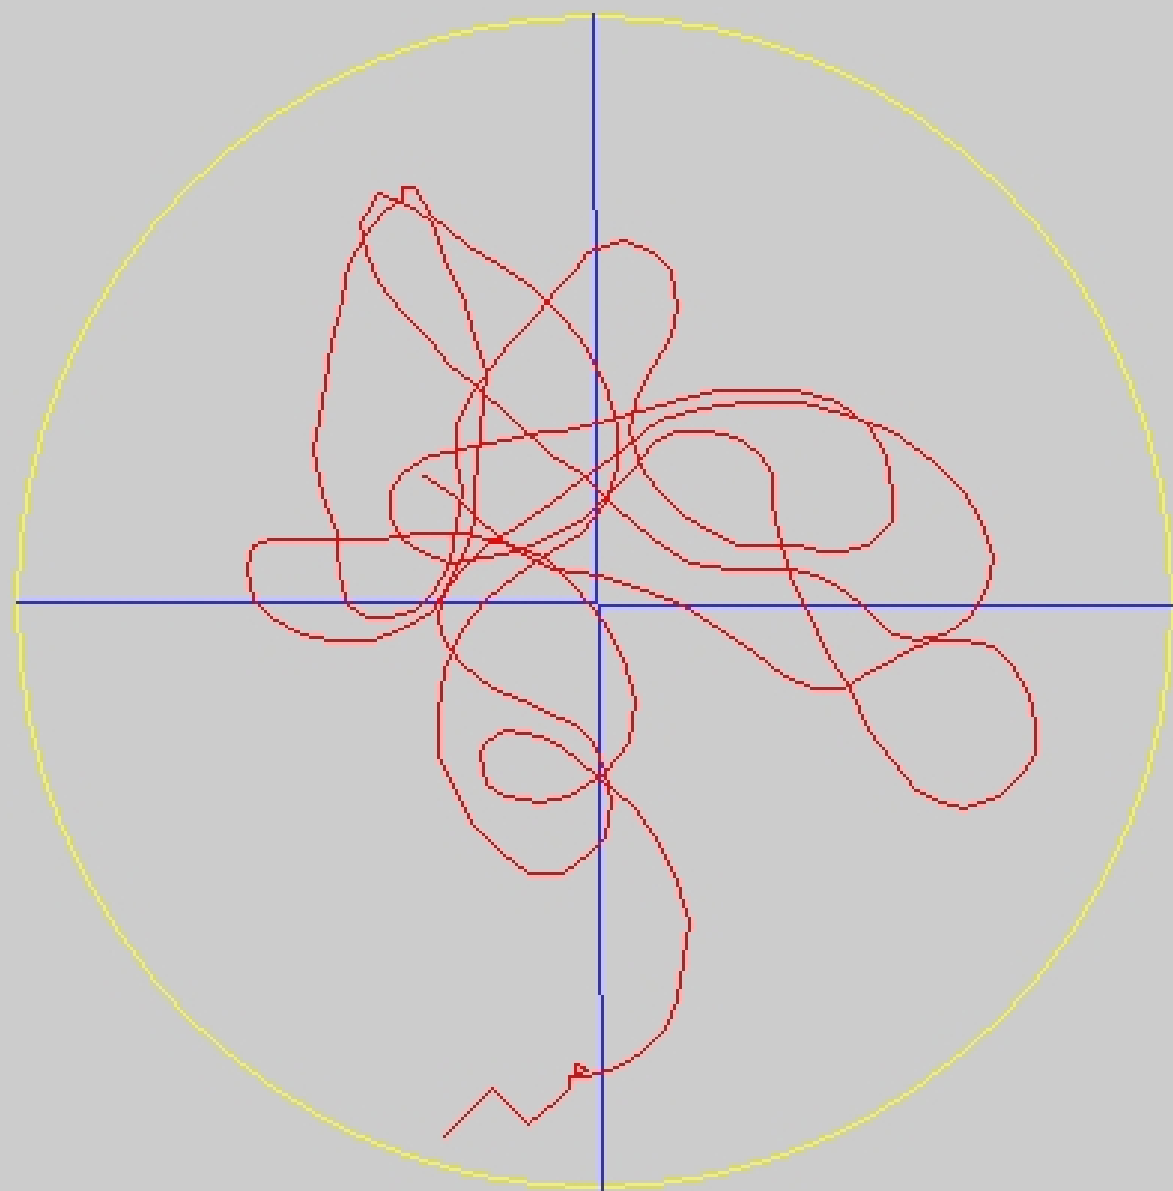

Learning and memory

Morris Water maze

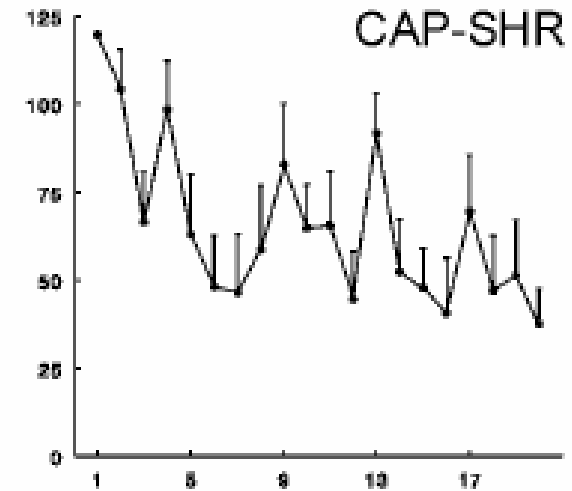

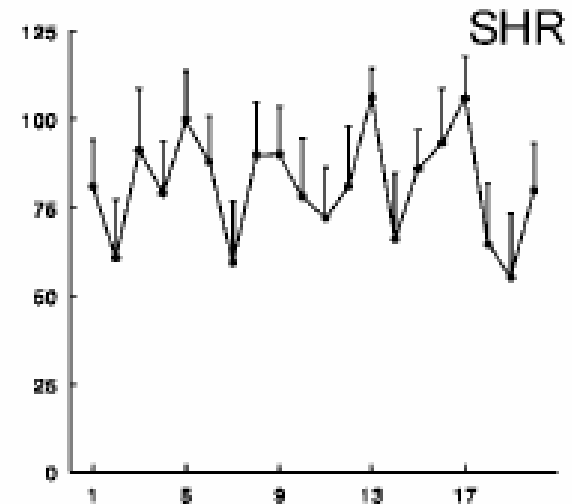

Which is smarter

- Latency to platform
 - Distance to platform
 - Role of Motor function
 - Role of Motivation
-
- What are the rodents seeking?

Reacquisition task

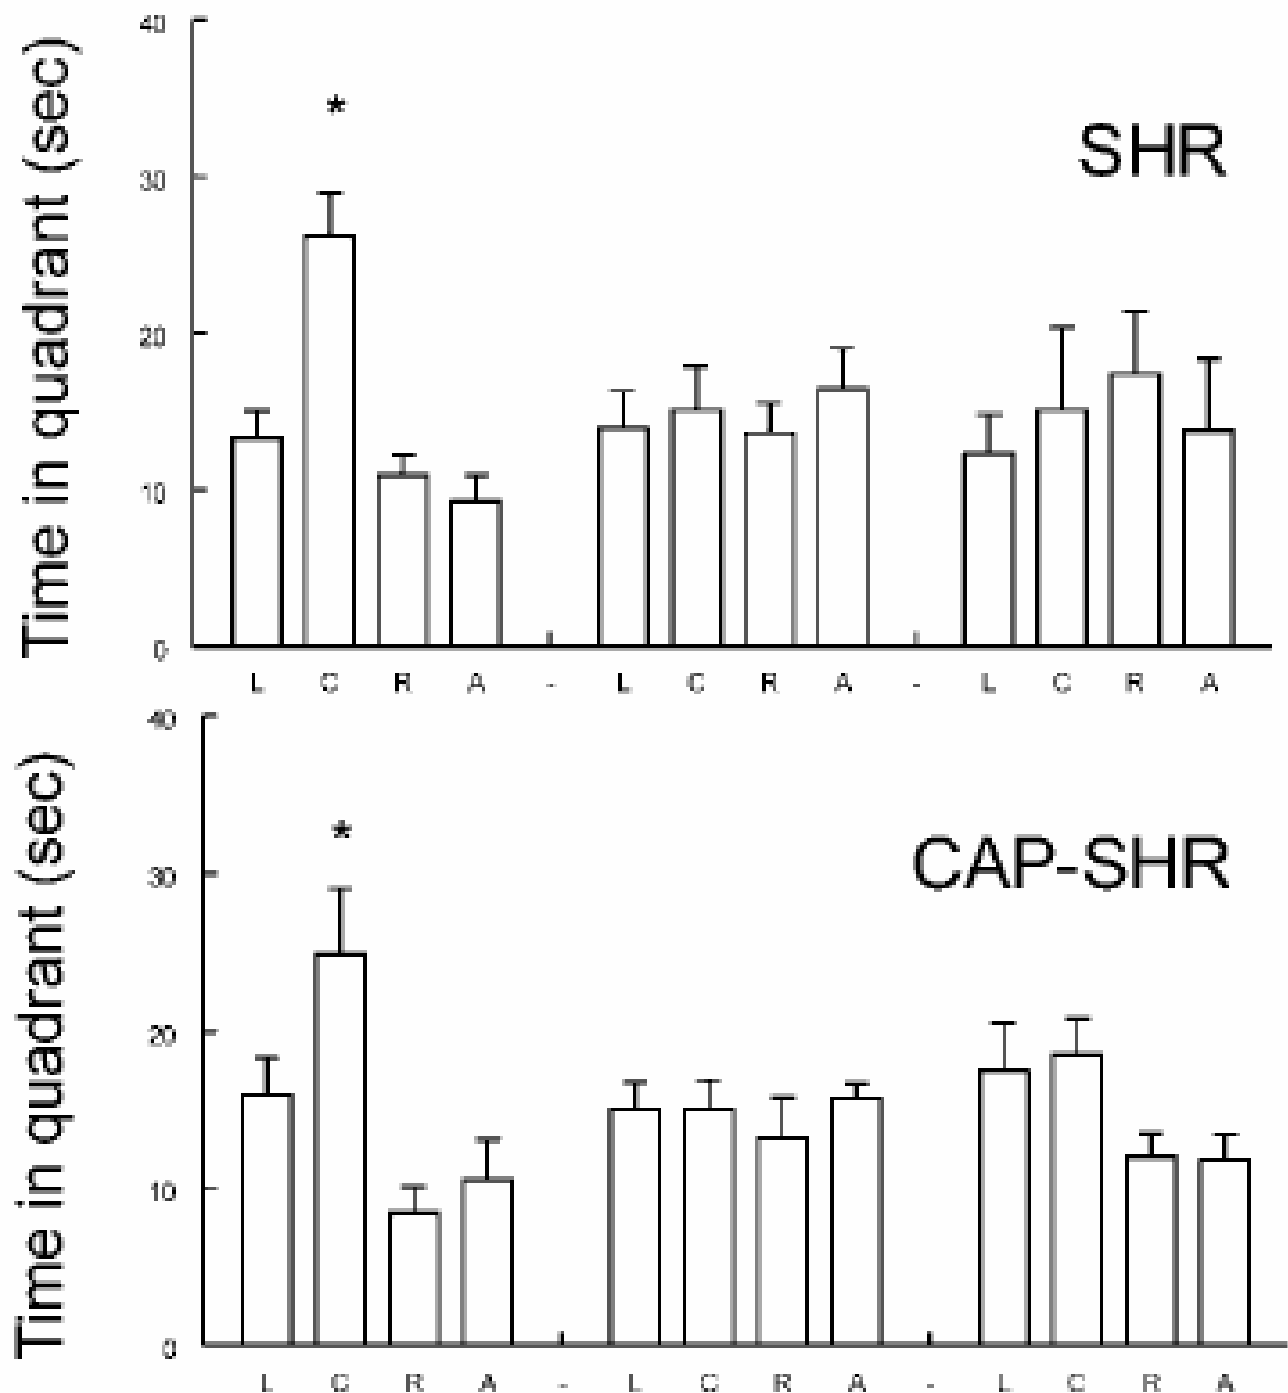

3 months

12 months

18 months

Probe trial

The interpretation of the data is all
important

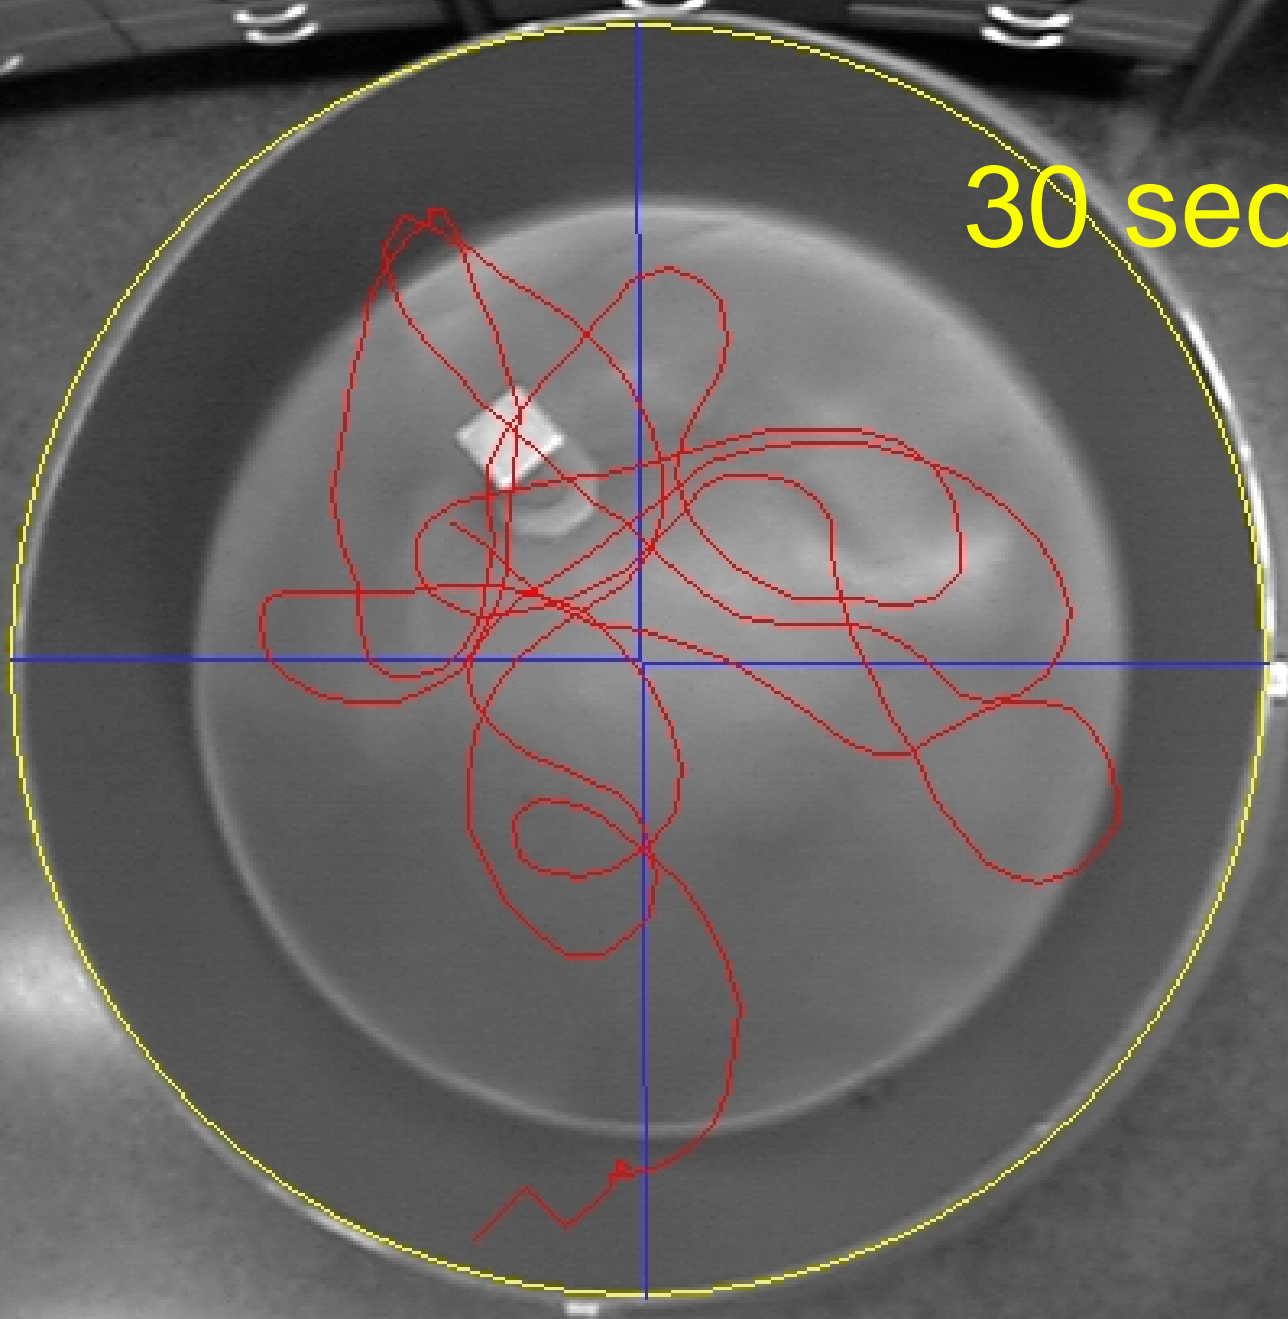

Note: many rats like to dive under water for 30'' at a time

30 sec. 3 m

30 sec. 9 m

A couple of lessons

- Rats like water better than mice.
- When rats and mice get fat, they can float.
 - Thus motivation changes with age.

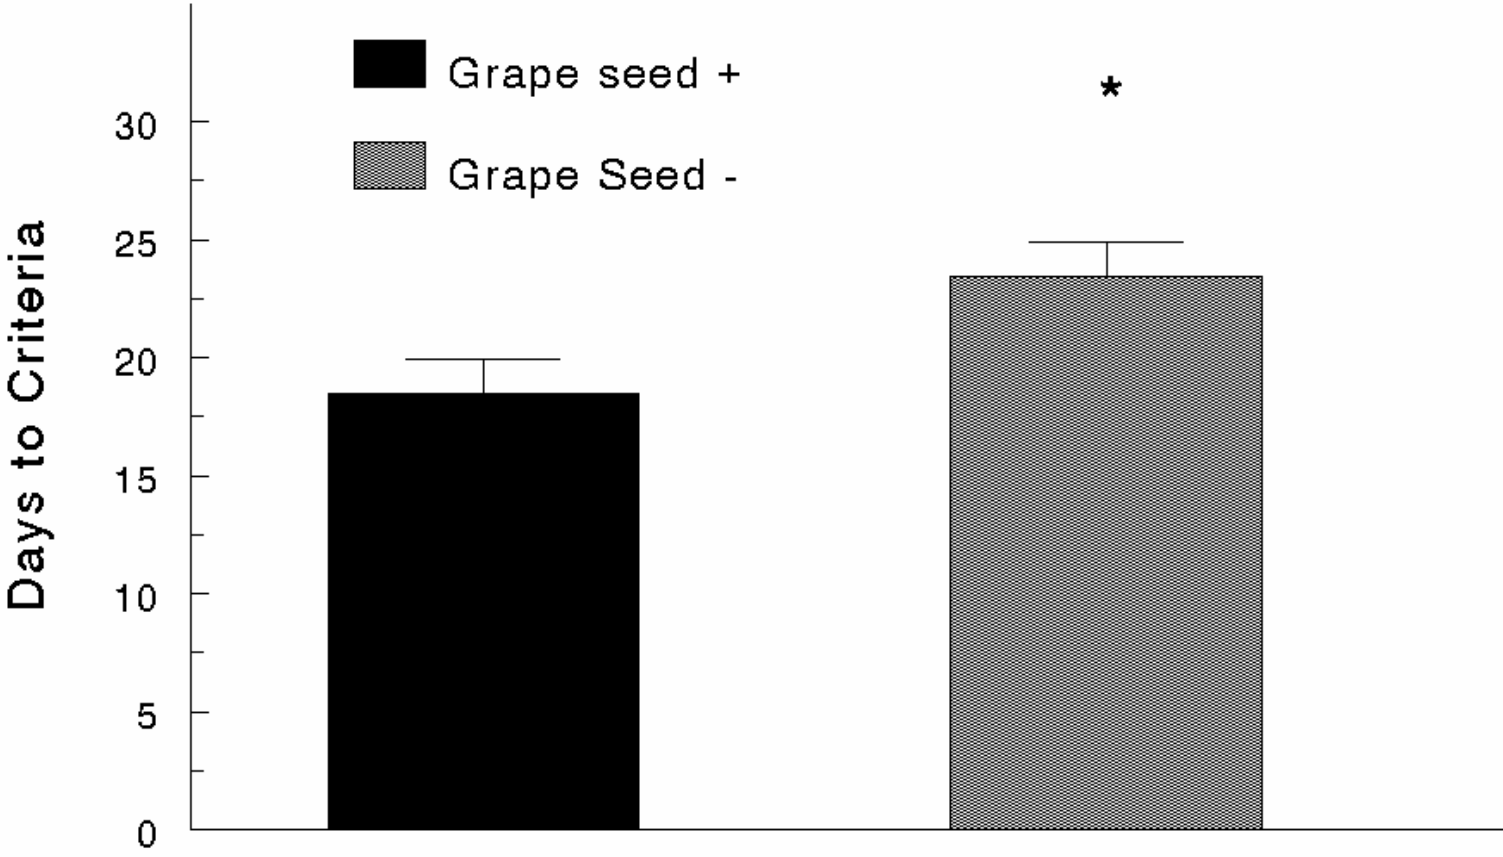

Dry mazes

Learning and memory

- Eight arm radial maze task
- Two arms are unbaited
- Completion criterion is to get 5 out of first 6 choices correct on 4 consecutive days
- Working memory error is same day re-entry into a previously visited arm
- Reference memory error is entry into an unbaited arm

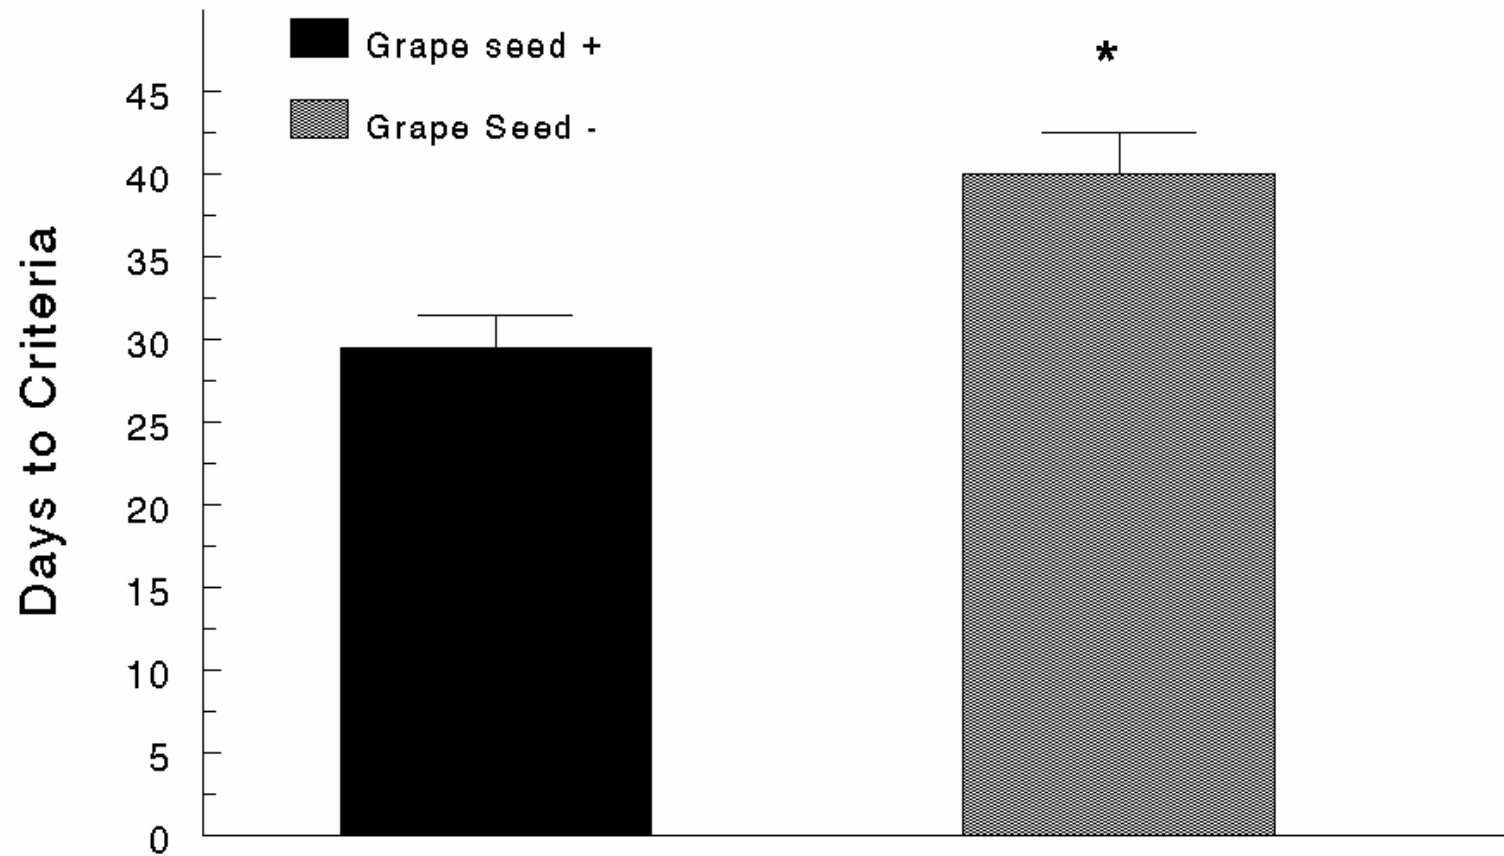

Mean Completion Times

Working Memory Errors

Reference Memory Errors

Radial dry maze

- Both mice and rats learn it well
- Relatively easy to interpret
- Can manipulate the difficulty by delay

- But
- It takes forever
- Motivation induced by diet restriction

FearFactor

Elevated plus maze

Motivation well controlled but it is negative US

Fear-induced memory related to the amygdala but positive stimuli are more related to the hippocampus.

1. Choose method wisely
2. Ensure that motor/sensory dysfunction does not underlie the differences observed
3. Choose the best test time
4. Choose a task that will discriminate (cost benefit)
