

## Modified Rankin Scale (mRS)

### Purpose

The modified Rankin Scale (mRS) is a scale commonly used for measuring the degree of disability or dependence in the daily activities of individuals who have suffered a stroke, and it has become the most widely used clinical outcome measure for stroke clinical trials.

Choose the score that most appropriately describes the subject's current state:

Description	Score (select one)
No symptoms at all	0 <input type="checkbox"/>
No significant disability despite symptoms; able to carry out all usual duties and activities	1 <input type="checkbox"/>
Slight disability; unable to carry out all previous activities, but able to look after own affairs without assistance	2 <input type="checkbox"/>
Moderate disability; requiring some help, but able to walk without assistance	3 <input type="checkbox"/>
Moderately severe disability; unable to walk without assistance and unable to attend to own bodily needs without assistance	4 <input type="checkbox"/>
Severe disability; bedridden, incontinent and requiring constant nursing care and attention	5 <input type="checkbox"/>
Dead	6 <input type="checkbox"/>
